

If you run a small business, a charity or a personal brand, your website has one job: turn visitors into enquiries. A slow, bloated site quietly loses you those enquiries every single day. That's exactly the problem [Astro](#) was built to solve — and it's why I build almost every client site with it.

Zero JavaScript by default

Most modern frameworks send a large JavaScript bundle to every visitor, even for a simple brochure site. The browser then has to download, parse and execute all of it before the page becomes interactive. Astro flips this on its head: it renders your pages to static HTML at build time and ships **no JavaScript at all** unless a specific component genuinely needs it.

The result is pages that appear almost instantly, even on a mid-range phone over a patchy mobile connection — which is how most people will actually visit your site.

Perfect Core Web Vitals, out of the box

Google uses Core Web Vitals as a ranking signal. Because Astro sites are mostly static HTML and CSS, they naturally score well on:

- **LCP** (Largest Contentful Paint) — content is in the HTML, so it paints fast.
- **CLS** (Cumulative Layout Shift) — no late-loading scripts shoving content around.
- **INP** (Interaction to Next Paint) — barely any JavaScript to block the main thread.

Content is easy to manage

Astro's **content collections** let me store your blog posts and pages as simple Markdown files with type-safe frontmatter. That means fewer moving parts, no database to hack, and no plugin soup to keep updated.

The bottom line

Astro gives small organisations enterprise-grade performance without the enterprise budget. Faster pages, better rankings, lower hosting costs and a site that's genuinely a pleasure to use.
